

INTREPID Study

Vercise™ Implantable Neurostimulator
For Treatment of Parkinson's Disease

+ TAKING AIM AT PARKINSON'S...

+ A DEEP BRAIN STIMULATION CLINICAL RESEARCH STUDY

- + Have you been diagnosed with Parkinson's disease for 5 years or longer?
- + Are you experiencing disabling Parkinson's disease symptoms or drug side effects despite taking anti-Parkinson's disease medication(s)?
- + Are you less than 75 years old?

If you answered "yes" to all these questions, you might be a candidate for a clinical research study, called INTREPID, sponsored by Boston Scientific.

The clinical research study is looking to evaluate the safety and effectiveness of the Vercise™ Deep Brain Stimulation (DBS) system as a therapy for reducing some of the symptoms associated with Parkinson's disease (PD) that are not adequately controlled with medication.
