# Effects of $\alpha/\gamma$ PPAR Activation

Nuclear receptors that function as transcription factors regulating the expression of genes

# Pioglitazone - PPAR $\gamma$ Activator

## Meta-Analysis

Death, MI, or Stroke – 16,390 Pts

Lincoff et al. JAMA 2007;298:1180-1188.

## PERISCOPE Trial

Coronary Intravascular Ultrasound

Nissen et al. JAMA 2008;299:1561.

# Aleglitazar - Balanced PPAR $\alpha/\gamma$ Agonist

## SYNCHRONY Phase 2 Trial

Henry R et al. Lancet 2009;374:126.

## AleCardio trial

### Study Hypothesis:

Aleglitazar, added to standard of care of pts with T2DM and recent acute coronary syndrome (ACS), would reduce cardiovascular mortality and morbidity.

- phase 3
- superiority trial
- randomized, placebo-controlled, double-blind, multicenter

## Inclusion and Exclusion Criteria

- ✓ Hospitalized with ACS (STEMI, NSTEMI, or UA)
- ✓ Type 2 DM (managed by diet or medication)
- ✓ Patients could be randomized at:
  - hospital discharge for index ACS
  - after screening period of up to 12 wks to allow clinical stabilization, completion of planned revascularization, achievement of steady state renal function.

- x Heart failure – Class II-IV
- x Heart failure hospitalization in prior 12 months
- x Severe peripheral edema
- x CKD - eGFR <45 ml/min-1.73 m<sup>2</sup>
- x Fasting triglycerides > 400 mg/dL
- x Ongoing Rx with fibrate or TZD
- x Liver disease
- x Anemia – Hgb <10 mg/dL

## Endpoints

### Primary

- Time to CV death, non-fatal MI, non-fatal stroke

### Secondary

- Time to CV death, non-fatal MI, non-fatal stroke, hosp for UA
- Time to all-cause death, non-fatal MI, non-fatal stroke
- Time to unplanned coronary revascularization

### Exploratory

- Glycemic control
- Changes in lipid levels

### Safety

- Hospitalization due to heart failure
- Renal safety composite – (ESRD, doubling SCr, 50% increase in SCr leading to study drug D/C)
- AEs of special interest – fluid retention, edema, weight, bone fx, hypoglycemia, malignancies

Type 2 DM and recent Acute Coronary Syndrome  
(STEMI, NSTEMI or UA)

**N ~ 7000 Patients Randomized**  
Double blind, 1:1 Ratio  
Up to 12 weeks after index event

**Aleglitazar**  
150 µg/day in morning

**Placebo**

Study visits: 1, 3, 6, 9, 12 mos, then alternative visits and phone q3 mos

Event Driven – 950 positively-adjudicated 1° Endpoint events  
Anticipated ~2.5 years follow-up

## Statistics

- Primary efficacy analysis using intention-to-treat (ITT) population
  - Placebo group event rate 10% 1<sup>st</sup> year, 4% annually thereafter
  - 20% relative risk reduction with aleglitazar
  - $\alpha = 0.01$  (2-sided);  $\beta = 0.80$  by log-rank test
- Accrual of 950 positively-adjudicated primary endpoint events
- Initial sample size – 6000 pts over 2.5 yr follow-up
- Observed event rate lower than expected – size increased to 7000 pts
- 
- Interim analysis was planned at accrual of 80% of expected 1<sup>o</sup> endpoint events (760 of required 950) for early termination for:
    - efficacy –  $P < 0.001$
    - futility – conditional power  $< 10\%$  for two-sided  $P < 0.05$

Statin	92	93

## Early Termination of Trial

- identified higher incidence of specific adverse events in aleglitazar group
- directed *unplanned* futility analysis to be performed for 8<sup>th</sup> scheduled meeting

**Unplanned interim analysis – 522 adjudicated events (55% of projected total)**

**HR = 1.01 [95% CI 0.85-0.19, P = 0.95]**

**Futility analysis - <1% conditional power for superiority to P<0.05**

- DSMB recommended termination of trial for futility
- Exec Committee and Sponsor agreed – trial terminated July 2, 2013

**Finalization of trial database on December 17, 2013:**

**704 adjudicated primary endpoint events – 74% of predicted**

**Median follow-up – 104 weeks (IQR 82-129)**

## Cardiovascular Death, Non-Fatal MI, Non-Fatal Stroke

### No. at risk:

Placebo	3610	3394	3252	2720	1706	773	118
Aloglitazar	3616	3387	3249	2731	1688	780	101

## Cardiovascular Efficacy Endpoints

Number of Patients (%)	ALE N = 3616	PLAC N = 3610	HR (95% CI)	P
1° Composite – CVD, MI, stroke	344 (9.5)	360 (10.0)	0.96 (0.83-1.11)	0.57
CV death, MI, stroke, UA hosp	441 (12.2)	488 (13.5)	0.90 (0.79-1.02)	0.11
Death, MI, stroke	373 (10.3)	392 (10.9)	0.95 (0.83-1.10)	0.51
Death from any cause	148 (4.1)	138 (3.8)	1.08 (0.85-1.36)	0.54
CV Death	112 (3.1)	98 (2.7)	1.15 (0.87-1.50)	0.32
Non-fatal MI	212 (5.9)	239 (6.6)	0.89 (0.74-1.07)	0.22
Non-fatal stroke	49 (1.4)	50 (1.4)	0.98 (0.66-1.45)	0.92
Unstable angina hospitalization	118 (3.3)	155 (4.3)	0.75 (0.59-0.96)	0.02
Unplanned Revascularization	397 (11.0)	498 (13.8)	0.79 (0.69-0.90)	<0.001

## Hospitalization for HF

Percent with Event

HR = 1.22 (95% CI, 0.94-1.59)  
p = 0.14

## Body Weight

Abs Change in Weight, (kg)

4.6 kg vs. 0.9 kg, P <0.001

### Heart Failure Serious Adverse Event:

Aleglitazar 4.7% vs Placebo 3.8%, HR 1.24; 95% CI 0.99 to 1.66, P = 0.06

### Peripheral Edema:

Aleglitazar 14.0% vs Placebo 6.6%, P <0.001

## Change in Creatinine

**Composite Renal Endpoint:**  
**Aleglitazar 7.4% vs Placebo 2.7%, HR 2.85; 95% CI 2.25 to 3.60; P <0.001**

## GI Hemorrhage

Hazard Ratio 1.44; (95% CI, 1.03 - 2.00)  
Log-rank P = 0.03

## Bone Fractures

Hazard Ratio 1.30; (95% CI 0.94 - 1.80)  
Log-rank P = 0.11

## Hypoglycemia (at least one event):

Aleglitazar 17% vs Placebo 11%  
HR 1.60; 95% CI 1.41 to 1.82; P <0.001

## Conclusions

When added to standard of care of patients with Type 2 diabetes and recent ACS, the dual PPAR-activator aleglitazar:

- reduced glycated hemoglobin
- improved levels of triglycerides and HDL-C
- did not reduce the risk of cardiac mortality, MI, or stroke
- increased risk of heart failure, renal dysfunction (reversible), bone fractures, GI hemorrhage, and hypoglycemia.

Adverse effects highlight difficulties involved in development of PPAR activating drugs - unique patterns of gene modulation result in complex effects on metabolic pathways and unpredictable therapeutic profiles.

These findings do not support the use of aleglitazar to reduce CV risk.
