Introduction and Executive Summary

Mercy Medical Center embraced a comprehensive, collaborative process in development of our Community Health Needs Assessment. Our deeply-rooted mission calls us to continually enhance our services and programs that improve patient care and outcomes, and equally important, to work collaboratively and proactively with other organizations in our community to address the needs of the underserved and vulnerable in our community. Our longstanding approach to Community Benefit has been driven by this mission. We were guided by this mission in the development of our CHNA.

Soon after passage of the 2010 Patient Protection and Affordable Care Act, Mercy joined with the other two not-for-profit hospitals located in Stark County, Ohio; the Stark County Health Department; Canton City Health Department; Alliance City Health Department; Stark County Mental Health and Recovery Services Board; and numerous other agencies to begin the process of developing a comprehensive Community Health Needs Assessment. An Advisory Committee was formed, facilitated by the Stark County Health Department. A data subcommittee gathered extensive secondary data to inform our work, and a community survey was conducted. Extensive work on the Stark County Community Health Needs Assessment was conducted in 2011 by The Center for Marketing and Opinion Research (CMOR) on behalf of the Advisory Committee. The three local hospitals, including Mercy Medical Center, paid for the services of CMOR.

Following the initial study, Mercy Medical Center continued a leadership role with the Advisory Committee in convening two Summits (one in November of 2011 and one in December of 2012) of concerned agencies and organizations to seek their input, and to inform and mobilize our community to create and implement a health improvement plan for Stark County – efforts that are now ongoing and focus on three areas from the identified health needs: obesity and healthy lifestyle choices; access to health insurance coverage and health care services; and mental health wellness. (Prescription drug abuse was integrated into the mental health wellness category, and access to dental care was integrated into the access to health care services category.)

In 2012, an internal Mercy Medical Center committee was convened to review the work performed to date and to provide further input.

In 2013, Mercy Medical Center again contracted with CMOR to update the data collected in the original CHNA work as possible, as well as to integrate additional data from Mercy's patients and secondary markets. The focus groups, conducted in April 2013, consisted of Mercy's patients who are served by our Internal Medicine, OB/GYN and Dental clinics. This process sought to discover the role these key access points serve in our community, how they fill needs that would not be met if we did not provide these services. The findings of the focus groups are included in this document. As an additional step to gain an understanding of our primary and secondary markets, secondary data with health statistics and demographics were gathered and analyzed. The data are included in this document.

The review by our internal committee, the findings from the focus groups and the secondary data reinforced the findings of the 2011 Stark County Health Needs Assessment work.

The top five health needs identified through the initial CHNA and confirmed with additional research in 2013 were:

1. Access to health insurance coverage and health care
2. Obesity and lack of healthy lifestyles
3. Prescription drug abuse
4. Large need for mental health services
5. Access to dental care

THE COMMUNITY HEALTH NEEDS ASSESSMENT ADVISORY COMMITTEE

The Stark County Community Health Needs Assessment (CHNA) Advisory Committee is made up of a variety of health and social services agencies and community volunteers including Access Health Stark County; Affinity Medical Center; Alliance Community Hospital; Alliance City Health Department; Aultman Health Foundation; Canton City Health Department; Canton Community Clinic; Mercy Medical Center; Prescription Assistance Network of Stark County; Stark County Family Council; Stark County Health Department; Stark County Jobs & Family Services; Stark County Medical Society; Mental Health & Recovery Services Board of Stark County; United Way of Greater Stark County; and Western Stark Free Clinic. **Thank you to all who volunteered their time and expertise to help make this collaboration successful, with special recognition to Stark County Health Department for its role.**

A listing of participants in Mercy Medical Center's CHNA process is found at the end of this document.

About Mercy Medical Center (*learn more at www.cantonmercy.org*)

As a Catholic health care organization, our mission at Mercy Medical Center is to continue Christ's healing ministry by providing quality, compassionate, accessible and affordable care for the whole person.

Mercy Medical Center is a ministry of the Sisters of Charity Health System (www.sistersofcharityhealth.org), a system devoted to healing and addressing the unmet needs of individuals, families, and communities through a network of innovative services including health care, foundations, and human services. Another ministry of the Health System serving Mercy's community is the Sisters of Charity Foundation of Canton, who have partnered with Mercy in addressing health care access for the poor and underserved through impactful, innovative programs.

Founded in 1908 in Canton, Ohio, by the Sisters of Charity of St. Augustine, Mercy has remained true to its mission in service to our community since the Sisters opened the doors of Mercy Hospital to a growing, diverse community to provide quality health care to all, regardless of race, religion, nationality and ability to pay.

We have grown into a nationally recognized health care organization that includes our main campus hospital in Canton; Mercy Dental Residency Program and Dental Services on the main campus; seven community health centers that provide services in North Canton, Jackson Township, Plain Township, Lake Township, Louisville, Carroll County, and Tuscarawas County; and an imaging center in Alliance. In addition, Mercy Primary Care - St. Paul Square medical home was opened in 2012 in the medically underserved Northeast section of Canton. Our new medical home provides primary care to pediatric and adult patients and a satellite office of Mercy Dental Services; at this site we also collaborate with Community Services of Stark County to provide mental health services.

Approximately 620 physicians and dentists are on Mercy's medical staff. Mercy employs approximately 2500 people, including Mercy Professional Care Corporation network of physicians. Mercy is a teaching hospital affiliated with Northeast Ohio Medical University (NEOMED). Our hospital has 475 licensed adult beds, a Level II Trauma Center and Emergency Department that has had 65,000 patient visits annually in recent years; an accredited Emergency Chest Pain Center (ECPC) with a dedicated, state-of-the-art heart catheterization laboratory located right in the ECPC.

Centers of excellence include Mercy Heart Center, Mercy Cancer Center, Surgery Center, Regional Rehabilitation Center, Primary Stroke Program, and Breast Care Center. Recent achievements and awards include:

- Top 50 Cardiovascular Hospitals in the Nation - Truven Health Analytics 2013 Report (Mercy Heart Center has been on the list of Top CV hospitals for six years)
- Mercy Cancer Center received the Outstanding Achievement Award of the American College of Surgeons Commission on Cancer in 2012 for the second consecutive period
- Mercy Stroke Center -- accredited as a Primary Stroke Center by The Joint Commission -- earned the 2012 American Heart Association/American Stroke Association's Get With The Guidelines Gold Plus Quality Achievement Award
- Mercy Breast Care Center designated a Breast Imaging Center of Excellence by the American College of Radiology 2012
- Mercy's Adult Inpatient Hospital Rehabilitation Program and its Adult Inpatient Hospital Stroke Rehabilitation Specialty Program earned three-year accreditation in 2012 from the Commission on Accreditation of Rehabilitation Facilities (CARF), the hospital program for the 18th time, the stroke program for the first time.
- Mercy Medical Center in 2012 received the American Heart Association's Mission: Lifeline Heart Attack STEMI Receiving Center Accreditation and is one of two in Ohio to receive the Mission: Lifeline Gold Performance Achievement Award.
- Mercy Health & Fitness Center earned certification in 2012 as a medical fitness facility by the Medical Fitness Association – the country's leading organization dedicated solely to medically integrated outcomes and accountability based fitness facilities.
- Mercy Medical Center received full heart failure accreditation in 2012 from the [Society of Cardiovascular Patient Care \(SCPC\)](#), an international not-for-profit organization that focuses on transforming cardiovascular care by assisting facilities in their effort to create communities of excellence that bring together quality, cost and patient satisfaction.
- Mercy Medical Center was a 2012 Healthy Ohio Worksite Award recipient. The awards, presented by the Ohio Department of Health's Office of Healthy Ohio, acknowledge Ohio employers that demonstrate a commitment to employee health by incorporating comprehensive worksite health promotion and wellness programs.
- For the fourth year in a row, Mercy Medical Center in 2012 earned the U.S. Environmental Protection Agency's (EPA's) ENERGY STAR certification, which signifies that the building performs in the top 25 percent of similar facilities nationwide for energy efficiency and meets strict energy efficiency performance levels set by the EPA. Mercy's Carroll County facility also earned this distinction in 2012.
- Mercy has embraced the goals of the Catholic Health Association's "Faithfully Healing the Earth" environmental stewardship program, and earned the top environmental award of the Ohio Hospital Association in 2012.

Mercury Medical Center's Community

Our primary market comprises 44 zip codes in Stark County, Ohio. Our secondary markets comprise 20 zip codes in Tuscarawas County and 8 zip codes in Carroll County.

About the Center for Marketing and Opinion Research

The Center for Marketing & Opinion Research (CMOR) is an Akron-based public opinion research firm providing services to colleges and universities, hospitals and healthcare organizations, and community-based organizations and government agencies. CMOR’s research capabilities include telephone, web and mail surveys, field, intercept and key informant interviews, focus group administration, as well as a wide range of consulting services including secondary data compilation and analysis.

CMOR has extensive experience in working with area hospitals and healthcare organizations, including benchmarking studies, image and awareness, strategic plan research, and Community Health Needs Assessments.

Research Methodology

The initial Stark County Community Health Needs Assessment work was conducted in 2011 by The Center for Marketing and Opinion Research (CMOR) on behalf of the Advisory Committee. The three local hospitals, including Mercy Medical Center, paid for the services of CMOR. In 2013, Mercy Medical Center again contracted with CMOR to update the data collected as well as to integrate additional data from Mercy's patients and secondary markets. Data from both 2011 and 2013 is included in this document.

COMMUNITY SURVEY (2011)

The first phase of the project consisted of the collection of primary data utilizing a random sample telephone survey of Stark County households that included a representative sample of Stark County residents as well as an oversample of African-American households. Telephone interviews were utilized in order to ensure representativeness of the population. This method also ensured that the correct number of interviews would be completed to meet the targeted sampling error.

Fifteen questions were included on the Stark Poll. The 2011 Stark County Collaborative Poll is a large-scale, random sampling survey of households in Stark County. The final sample of the poll consisted of a total of 1,067 respondents. The general population statistics derived from the sample size provide a precision level of plus or minus 3% within a 95% confidence interval. This portion of the research was funded by Alliance Community Hospital, Aultman Health Foundation and Mercy Medical Center.

The Stark Poll consists of questions posed by multiple organizations. Questions posed on behalf of Stark County Health Needs Assessment Committee for this health assessment were designed in cooperation between the committee and CMOR staff.

Data Collection began on April 27 and ended on June 20, 2011. Most calling took place between the evening hours of 5:30 pm and 9:00 pm. Some interviews were conducted during the day and on some weekends to accommodate respondent schedules. The interviews took an average of 22.01 minutes.

An oversample of approximately 150 African-American residents was conducted in addition to the 1067 interviews in order to attain enough cases of this population to be able to draw conclusions that were statistically valid. Combined with cases from the original administration, a total of 225 interviews were conducted with African Americans. The general population statistics derived from the sample size provided a precision level of plus or minus 6.5% within a 95% confidence interval and allowed for CMOR to analyze this demographic group independently. Data Collection began on July 12 and ended on August 26, 2011. The interviews took an average of 11.13 minutes.

FOCUS GROUP (2013)

The Center for Marketing and Opinion Research (CMOR) conducted two focus groups on behalf of Mercy Medical Center in April 2013 to collect patient perception data to be included in Mercy Medical Center's Community Health Needs Assessment Implementation Plan. The two groups included patients from the Ambulatory Care Clinic (Internal Medicine and OB/GYN) and the Dental Clinic. These focus groups were moderated by CMOR on April 2 and 3, 2013.

SECONDARY DATA (2011 and 2013)

The final phase of this study consisted of reviewing and analyzing secondary data sources to identify priority areas of concern when analyzed alongside survey data. CMOR gathered and compiled health and demographic data from various sources (outlined below). After gathering the data, CMOR compiled the information, by category. When available, data was compared to other geographic areas such as Ohio. Using all data available, CMOR identified priorities for the county.

Focus Areas:

- | | | |
|----------------------|-----------------------|--------------|
| ✓ Diet and Exercise | ✓ Tobacco use | ✓ Birth |
| ✓ Mental Health | ✓ Preventative Health | ✓ Education |
| ✓ Chronic conditions | ✓ Health Insurance | ✓ Employment |
| ✓ General health | ✓ Mortality | ✓ Income |
| ✓ Health care access | ✓ Morbidity | |

Following is a detailed breakdown of ranking sources for the County Health Rankings, a secondary data report that is important to Mercy’s CHNA (see listing on previous page)

Health Outcome Summary Score and Rankings

Health outcomes in the *County Health Rankings* represent how healthy a county is. It measures two types of health outcomes: how long people live (mortality) and how healthy people feel while alive (morbidity).

Health Outcome Weights				
Focus Area	Measure	Weight	Source	Year(s)
Mortality (50%)	Premature death (years of potential life lost before age 75 per 100,000 pop)	50%	National Center for Health Statistics	2008-2010
Morbidity (50%)	Poor or fair health (percent of adults reporting fair or poor health)	10%	Behavioral Risk Factor Surveillance System	2005-2011
	Poor physical health days (average number in past 30 days)	10%	Behavioral Risk Factor Surveillance System	2005-2011
	Poor mental health days (average number in past 30 days)	10%	Behavioral Risk Factor Surveillance System	2005-2011
	Low birth weight (percent of live births with weight < 2500 grams)	20%	National Center for Health Statistics	2004-2010

Website: <http://www.countyhealthrankings.org/app/ohio/2013/rankings/outcomes/overall/by-rank>

Health Factors Summary Score and Rankings

Health factors in the *County Health Rankings* represent what influences the health of a county. We measure four types of health factors: health behaviors, clinical care, social and economic, and physical environment factors. In turn, each of these factors is based on several measures (listed below).

Health Factor Weights				
Focus Area	Measure	Weight	Source	Year(s)
Health Behaviors (30%)				
Tobacco use (10%)	Adult smoking (percent of adults that smoke)	10%	Behavioral Risk Factor Surveillance System	2005-2011
Diet and exercise (10%)	Adult obesity (percent of adults that report a BMI >= 30)	7.5%	National Center for Chronic Disease Prevention and Health Promotion, Division of Diabetes Translation	2009

Health Factor Weights				
Focus Area	Measure	Weight	Source	Year(s)
	Physical inactivity (percent of adults that report no leisure time physical activity)	2.5%	National Center for Chronic Disease Prevention and Health Promotion, Division of Diabetes Translation	2009
Alcohol use (5%)	Excessive drinking (percent of adults who report heavy or binge drinking)	2.5%	Behavioral Risk Factor Surveillance System	2005-2011
	Motor vehicle crash deaths per 100,000 population	2.5%	National Center for Health Statistics	2004-2010
Sexual activity (5%)	Sexually transmitted infections (chlamydia rate per 100,000 population)	2.5%	National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention	2010
	Teen birth rate (per 1,000 females ages 15-19)	2.5%	National Center for Health Statistics	2004-2010
Clinical Care (20%)				
Access to care (10%)	Uninsured (percent of population < age 65 without health insurance)	5%	Small Area Health Insurance Estimates	2010
	Ratio of population to primary care physicians	3%	HRSA Area Resource File	2011-2012
	Ratio of population to dentists	2%	HRSA Area Resource File	2011-2012
Quality of care (10%)	Preventable hospital stays (rate per 1,000 Medicare enrollees)	5%	Dartmouth Atlas of Health Care	2010
	Diabetic screening (percent of diabetics that receive HbA1c screening)	2.5%	Dartmouth Atlas of Health Care	2010
	Mammography screening (percent of females that receive screening)	2.5%	Dartmouth Atlas of Health Care	2010
Social and Economic Environment (40%)				
Education (10%)	High school graduation (percent of ninth grade cohort that graduates in 4 years)	5%	State sources and the National Center for Education Statistics	Varies by state
	Some college (Percent of adults aged 25-44 years with	5%	American Community Survey, 5-year estimates	2007-2011

Health Factor Weights				
Focus Area	Measure	Weight	Source	Year(s)
	some post-secondary education)			
Employment (10%)	Unemployment rate (percent of population age 16+ unemployed)	10%	Bureau of Labor Statistics	2011
Income (10%)	Children in poverty (percent of children under age 18 in poverty)	10%	Small Area Income and Poverty Estimates	2011
Family and social support (5%)	Inadequate social support (percent of adults without social/emotional support)	2.5%	Behavioral Risk Factor Surveillance System	2005-2010
	Percent of children that live in single-parent household	2.5%	American Community Survey, 5-year estimates	2007-2011
Community safety (5%)	Violent crime rate per 100,000 population	5%	Uniform Crime Reporting, Federal Bureau of Investigation <i>State data sources for Illinois</i>	2008-2010
Physical Environment (10%)				
Environmental quality (4%)	Daily fine particulate matter (average daily measure in micrograms per cubic meter)	2%	CDC WONDER Environmental data	2008
	Drinking water safety (percent of population exposed to water exceeding a violation limit in the past year)	2%	Safe Drinking Water Information System	FY 2012
Built environment (6%)	Access to recreational facilities (rate per 100,000 population)	2%	County Business Patterns	2010
	Limited access to health foods (percent of population who lives in poverty and more than 1 or 10 miles from a grocery store)	2%	USDA Food Environment Atlas	2012
	Fast food restaurants (percent of all restaurants that are fast food)	2%	County Business Patterns	2010

Website: <http://www.countyhealthrankings.org/app/ohio/2013/rankings/factors/overall/by-rank>

**Additional County Ranking Measures**

Additional Measures		
Measure	Source	Year(s)
Diabetes	National Center for Chronic Disease Prevention and Health Promotion, Division of Diabetes Translation	2009
HIV prevalence rate	National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention	2009
Premature age-adjusted mortality	CDC WONDER mortality data	2008-2010
Child mortality	CDC WONDER mortality data	2007-2010
Infant mortality	CDC WONDER mortality data	2006-2010
Mental health providers	HRSA Area Resource File	2011-2012
Health care costs	Dartmouth Atlas of Health Care	2009
Uninsured adults	Small Area Health Insurance Estimates	2010
Uninsured children	Small Area Health Insurance Estimates	2010
Could not see doctor due to cost	Behavioral Risk Factor Surveillance System	2005-2011
Median household income	Small Area Income and Poverty Estimates	2011
High housing costs	American Community Survey, 5-year estimates	2007-2011
Children eligible for free lunch	National Center for Education Statistics	2011
Access to parks	Environmental Public Health Tracking Network	2010

Ohio Youth Survey Methodology

In 2008-2009, Stark County was selected as part of a 10-county pilot to implement the Ohio Youth Survey. The project was approved by the Family and Children First Cabinet and was a collaborative effort of the Interagency Prevention Partnership (IPP), and Ohio's Expert Prevention Panel (EPP). The Ohio Youth Survey was administered in Stark County with the support of the Stark County Family Council, the iCare program of the Stark County Educational Services Center, and the Stark County Anti-Drug Coalition within the Mental Health and Recovery Services Board of Stark County.

Administration of the Survey

The web based Ohio Youth Survey was offered through SmartTrack, a computer-based data collection system. Students in grades 6, 8, and 10 had the opportunity to answer questions about safety and violence, physical activity and diet, alcohol, tobacco and other drug use as well as related risk and protective factors during the months of October and November 2008. The total sample size for this survey was 4,270. The Ohio Youth Survey is approximately 100 questions in length and most students were able to take the survey in an average of 25 to 30 minutes. Locally, the Ohio Youth Survey was administered through the iCARE Team office at the Educational Service Center. Each school was able to access reports related to their data.

Priority Health Issues

This section presents a summary of the priority health issues for Stark County. For each area, data is given to support the identified issue. In many cases there were significant differences between demographic groups. The demographic characteristics that had the largest impact were race, income, and age. The priority health issues were identified after analyzing multiple sources of data from both the initial Stark County Community Health Assessment work in 2011 as well as additional research in 2013 as outlined in the Research Methodology section. The areas were chosen because they were common themes that appeared throughout the multiple sources of data, and through careful deliberation by the many community and Mercy Medical Center thought leaders involved in the process.

ACCESS TO HEALTH INSURANCE COVERAGE AND HEALTH CARE

ISSUE: A large portion of county residents do not have health insurance and lack access to basic healthcare services

- Stark Poll: The 2011 Stark Poll found that 31.3% of respondents thought that the availability of health insurance was the greatest unmet health need in the county. Another 14.5% felt that the affordability of health care and insurance was the greatest unmet health need. Slightly less, 11.1% felt that health care for the elderly and youth were the most important unmet health need.
- Stark Poll: 13.3% of survey respondents indicated that they are without health insurance coverage. Demographic groups that had disproportionately high uninsured rates include those with an annual household income of \$18,000 or less (28.8%), the unemployed (24.3%), respondents with a high school diploma or less education (18.2%), those who are not married (20.4%), renters (27.8%), and respondents ages 18 to 24 (27.7%) and 25 to 34 (18.2%).
- Stark Poll: More than one-quarter, 28.6%, of respondents receive most of their healthcare from someone other than a primary care or family doctor. These include the emergency room (8.4%), a hospital clinic (7.7%) and an urgent care center (6.3%).

ACCESS TO DENTAL CARE

ISSUE: A significant portion of county residents do not have access to routine dental care.

- Stark Poll: 10.1% of respondents indicated that there were healthcare services that they needed but were unable to receive. The number one service that was needed was dental services. In all, 19.8% of those who were unable to get a needed service named this response. In addition, 2.8% of all respondents reported that the availability of dental care services as the greatest unmet health need in the county.
- ODJFS: The ODJFS reported that in 2008 a significant portion of county residents were without dental insurance- this included 20.9% of children, 37.6% of adults ages 18 to 64, and 55.1% of adults ages 65 and over. In terms of dental visits 28.7% of children, 39.6% of adults ages 18 to 64, and 41.0% of adults over 65 had not seen a dentist in the past year.
- ODH: The Oral Health Survey of Ohio Schoolchildren found that 19.2% of Stark County third graders did not visit a dentist in the past year. Other findings include: 60% have a history of tooth decay, 51% have one or more sealants, and 21% have untreated cavities.

PRESCRIPTION DRUG USE

ISSUE: A growing problem in Stark County is the use of prescription medication in ways other than prescribed, particularly among youth.

- Stark Poll: 2.3% of adults reported using prescription medications other than how they were prescribed. Groups of respondents that were more likely to report using prescriptions not as prescribed include the unemployed (5.1%), those with children in the home (4.0%), respondents ages 18 to 24 (5.9%), and those with an annual income of \$18-36,000 (4.7%).
- Ohio Youth Survey: 5.5% of students surveyed indicated that they used prescription drugs that were not prescribed to them in the past 30 days- higher than all other drugs, including inhalants.
- ODH: Death rates for accidental poisoning has increased significantly for ages 15 to 64 between 2002-2004 and 2005-2007: Ages 15-24: 671% increase, ages 25-34: 261% increase, ages 35-44: 105% increase, ages 45-54: 95% increase.
- ODH: The annual death rate among Stark County residents for unintentional drug/medication deaths for 2004-2008 was 5.9 per 100,000. While this rate is lower than the state average (10.4) for the same time period, Stark County's number of unintended deaths increased 100% between 2004 and 2008, while Ohio's number increased 59%.
- ODH: For 2003-2007, Stark County's rate of drug/medication poisoning hospital discharge cases was 125.1 per 100,000 population. This was considerably higher than the statewide rate of 90.5 and the 6th highest county rate in the state.

MENTAL HEALTH

ISSUE: The need for mental health treatment and intervention continues to increase, especially for youth. High diagnosis rates for depression as well as high percentage of youth with suicidal thoughts substantiate this issue.

- Ohio Youth Survey: 26.6% of students reported feeling so sad or hopeless almost every day for two weeks in a row that they stopped doing normal activities. In addition, 15.1% of students seriously considered attempting suicide in the past 12 months while 11.4% actually made a plan about how they would attempt suicide, and 8% reported trying to commit suicide in the past year.
- ODH: The actual suicide rate in Stark County for 2006 to 2008 was 10.8 per 100,000 people. Whites had much higher suicide rates (11.1) to African Americans (6.9). Suicides rates varied greatly by age. Age groups that had the highest suicide rates were 35-44 (19.5), 85 and older (18.5), 55-64 (15.0), and 25 to 34 (14.2). Males are nearly four times more likely to commit suicide than females at a 17.9 to 4.4 ratio.
- MHR SB: The top three diagnostic groups for the Stark MHR SB in 2010 for adults were depressive disorders (2,877 cases), bipolar disorders (2,372), and alcohol use disorders (1,745). As far as children, the top three diagnoses were conduct disorders (1,129 cases), adjustment disorders (1,089), and attention-deficit/disruptive disorders (763). The age groups that were most likely to utilize mental health services in 2010 were ages 25 to 34 (3,108 cases), 35 to 44 (2,450), 45 to 54 (2,368), and 18 to 24 (2,245).

OBESITY AND HEALTHY LIFESTYLE CHOICES

ISSUE: A large portion of county residents are overweight, not exercising regularly, and not making food choices based on nutritional information.

- Stark Poll: A significant portion, 44.2%, of respondents reported that they were somewhat or very overweight. Groups of respondents that were more likely to report being overweight were suburban residents (47.3%), those who are retired (48.4%) or unemployed (48.4%), females (49.3%), ages 35 to 44 (50.8%) or 45 to 54 (49.2%), married (50.2%), and income of under \$18,000 (56.2%). More than half of all respondents (57.4%) and most overweight respondents (87.7%) had tried to lose weight in the last 12 months.
- Ohio Youth Survey: 27% of the students who participated in the Ohio Youth Survey reported being overweight and 47% indicated that they were trying to lose weight.
- Stark Poll: 15.7% report not exercising at all while another 10.6% reported exercising only once in a while. The top reasons for not being able to exercise were physical limitations (49.2%), too busy or had no time (26.8%), and laziness or procrastination (10.6%).
- Stark Poll: 6.2% of all respondents rated their own health as poor or very poor. Groups of respondents that were more likely to rate their health as poor or very poor include: those who do not exercise (17.3%), respondents who are very overweight (17.7%), retired (11.8%) and unemployed (15.4%) respondents, renters (9.6%), those ages 55 to 64 (11.5%), non-white respondents (10.6%), and those with an annual income of less than \$18,000 (17.4%).
- Ohio Youth Survey: 10.7% of participating students disagreed with the statement that they are physically fit. A large portion of students, 46.4%, watch 3 or more hours of TV on an average school day and 34.3% use the computer or play video games 3 or more hours on an average school day. Nearly one-quarter, 24.8, get 6 hours or less of sleep a night.
- CDC: According to the CDC, in 2009, 36.8% of Stark County adults were considered overweight and an additional 32.7% were considered obese. In addition, 34.1%, of Stark County third-graders were either overweight or obese in 2009-2010.
- Stark Poll: Just over one-third of respondents, 37.5%, indicated that nutritional information had the most information on their food choices. Last portions of respondents were influenced most by convenience (19.3%), meals prepared by a family member (17.2%), and cost (15.9%).

Community Survey: 2011 Stark Poll

The Stark County Health Needs Assessment Committee asked a series of questions as part of the 2011 Stark County Health Needs Assessment on the Stark County Collaborative Poll. The Stark County Health Needs Assessment Committee’s involvement with the 2011 Stark Poll was funded by Alliance Community Hospital, Aultman Health Foundation, and Mercy Medical Center and was coordinated by the Stark County Health Department. The questions focused on the following areas: overall needs and health, general physical and mental health, access to care, immunizations, smoking and tobacco use, alcohol consumption, prescription medication abuse, obesity and access to healthy food, exercise and texting while driving. Where possible, comparative data from previous Stark Poll administrations were included throughout the analysis.

Overall Needs and Health

Stark Poll Summary: Overall Needs and Health			
		Percentage	N
Greatest Unmet Health Needs (open ended, Top 3)	Availability of health insurance	31.3%	N=568
	Affordability of health care / insurance	14.5%	
	Health care for the elderly / youth	11.1%	
Are there health programs like to see	Yes	35.1%	N=1,028
	No	64.9%	
Health care programs like to see (top 3)	Financial / insurance assistance	19.0%	N=337
	Free / preventive care clinics	18.4%	
	Youth fitness / nutrition / healthcare	13.1%	
Health Related Information Sources (top 3)	Internet	49.9%	N=983
	Friends/Family	42.2%	
	Doctor/Pharmacist/Nurse	32.6%	
How rate health	Excellent/Good	76.7%	N=1,065
	Fair	17.1%	
	Poor/Very Poor	6.2%	

The first section of the survey focused on unmet healthcare needs, additional healthcare services that respondents would like to see, and healthcare related information sources.

Healthcare Needs

First, all respondents were asked what they thought was the greatest unmet health need in Stark County. This was an open ended question in which the respondent could give one answer. A significant percentage of respondents, 46.7%, were unable to answer the question. Of those who were able to answer the question, nearly one-third, 31.1%, felt that the availability of health insurance was the greatest unmet health need in the county. The second largest unmet health need was the affordability of health care and health insurance, given by 14.4% of respondents. Slightly fewer, 11.1% of respondents thought that healthcare for the elderly or youth was the greatest unmet health need. Other needs, in order of importance, include public assistance (6.3% of respondents), the availability and affordability of medications (1.9%), mental health services (1.9%), and the availability of preventative care and clinics (1.6%).

Greatest Unmet Healthcare Need in Stark County			
	# of Responses	% of Responses	% of all Respondents
Availability of health insurance	178	31.3%	16.7%
Affordability of health care / insurance	82	14.4%	7.7%
Health care for the elderly / youth	63	11.1%	5.9%
Public assistance	36	6.3%	3.4%
Availability of medicine / affordability of medicine	20	3.5%	1.9%
Mental health services	20	3.5%	1.9%
Availability of preventive care / clinics	17	3.0%	1.6%
Availability of dental care services	16	2.8%	1.5%
Environmental concerns	16	2.8%	1.5%
Nutrition / obesity resources	16	2.8%	1.5%
Cures for diseases	13	2.3%	1.2%
Lack of nurses / doctors	13	2.3%	1.2%
Lack of high quality health care	12	2.1%	1.1%
Public healthcare plans	11	1.9%	1.0%
Teen pregnancy / STD care	7	1.2%	0.7%
Availability of drug / alcohol dependence assistance	5	0.9%	0.5%
Miscellaneous	41	7.2%	3.8%
Total	569	(n=569)	(n=1067)

Next, respondents were asked if there are any health care, health education or public health programs or services they would like to see in the community. More than one-third, 35.1%, of respondents indicated that there were health related programs or services they would like to see in their community.

The 35.1% of respondents who indicated they would like to see additional health related programs and services in their community were asked what programs and services they would like to see. This was an open ended question in which the respondent could give multiple responses. In total, there were 428 programs and services named by 337 service naming respondents. The program/service that was named most frequently was financial and insurance assistance. This response was given by 19.0% of answering respondents. Slightly less, 18.4%, of answering respondents wanted to see free and preventative care clinics in their community. Other services and programs the respondents wanted to see in their community, in order of importance, include healthcare, fitness, and nutrition programs and services for youth (13.1%), healthcare and fitness programs for the elderly (10.7%), fitness and nutrition programs in general (7.1%), education and seminars on healthcare topics (6.8%), education for specific conditions (6.5%), and dental and optical programs (5.6%).

What Healthcare Programs or Services Would You Like To See?					
	# of 1st Responses	% of 1st Responses	# of All Responses	% of all Responses	% of All Respondents
Financial / insurance assistance	44	13.1%	64	19.0%	6.0%

Assistance for veterans	3	0.9%	3	0.9%	0.3%
Miscellaneous	19	0.3%	19	5.6%	0.1%
Total	337	(n=337)	428	(n=428)	(n=1067)

Health Related Information

All respondents were asked what two sources of information they find most useful when looking for health related information such as information about doctors, diseases or available services. This was an open ended question. The most common response, given by nearly half of all respondents, 49.9%, was the internet. The second most common source of health related information was family and friends. This response was given by 42.2% of respondents. Nearly a third of respondents, 32.6%, felt that a doctor, pharmacist, or nurse was the most important source of health related information. Other sources of health related information include, in order of importance, the newspaper (8.5%), books or magazines (8.0%), television or radio (7.3%), and insurance resources (6.0%).

Source of Healthcare Information Most Useful (such as info about doctors and diseases)

Total	983	(n=983)	1669	(n=1669)	(n=983)

General Health

All respondents were asked to describe their health on a five-point scale: excellent, good, fair, poor or very poor. More than one-quarter of respondents, 27.0%, rated their health as excellent. Another half of respondents, 49.7%, rated their health as good. Combined, 76.7% had a favorable rating of their health. Another 17.1% of respondents rated their health as fair. Only a small percentage of respondents, 6.2%, had an unfavorable rating of their health, with 5.3% rating their health as poor and 0.9% as very poor.

There were several demographic differences among how a person rated their health. For example, college graduates were much more likely than those with a high school diploma or less education to have a favorable rating of their health. Whereas 86.3% of college graduates rated their health as excellent or good, only 67.9% of those with a high school diploma or less education rated their health favorably. Other groups of respondents that were more likely to rate their health as excellent or good include respondents who are employed, home owners, aged 18 to 44, married, and those with an annual income of \$54,000 or more. Groups of respondents that were more likely to rate their health as poor or very poor include retired respondents, those who rent their current residence, respondents ages 55 and over, non-white respondents, and those with an annual income of \$18,000 or less.

Access to Care

Stark Poll Summary: Access to Care			
		Percentage	N
Where receive healthcare most often	Primary care or family doctor	71.4%	N=1,061
	The emergency room	8.4%	
	A hospital clinic	7.7%	
	An urgent care center	6.3%	
	A VA hospital or clinic	2.3%	
	A free clinic	1.1%	
	A public health department or clinic	0.4%	
	Something else	2.4%	
Healthcare services unable to get*	Yes	10.1%	N=1,067
	No	89.9%	
Follow-up: What services needed (top 3)	Dental services	19.8%	N=104
	Orthopedics	10.3%	
	Medication	9.4%	
Follow-up: Why unable to get services (top 3)	No health insurance	37.1%	N=101
	Cannot afford it	27.0%	
	Services not covered by insurance	21.0%	

Next, respondents were asked when they receive healthcare, where do they receive it most often: a primary care or family doctor, the emergency room, an urgent care center, a hospital clinic, a public health department or clinic, a VA hospital or clinic, a free clinic, or somewhere else.

The leading source of health care for respondents was a primary care doctor. Nearly three-quarters or 71.4% of respondents indicated they receive their health care most often from a primary care doctor; this was a significant decrease from 77.7% of respondents in 2007. On the other hand, more than one-quarter or 28.6% of respondents relied on other sources for health care. For instance, 8.4% of respondents relied on emergency rooms as their primary source of health care, while another 7.7% relied on a hospital clinic. The percentage of respondents who used hospital clinics as their main source of health care increased considerably from 2.6% in 2007. Other sources of health care included, in order of importance, an urgent care center (6.3%), Veterans Administration (VA) hospitals or clinics (2.3%), free clinics (1.1), and public health departments (0.4%).

Where Receive Healthcare Most Often		
	2007	2011
Primary care or family doctor	77.7%	71.4%
The emergency room	8.3%	8.4%
A hospital clinic	2.6%	7.7%
An urgent care center	4.6%	6.3%
A VA hospital or clinic	2.6%	2.3%
A free clinic	1.3%	1.1%
A public health department or clinic	0.5%	0.4%
Something else	1.6%	2.4%

Whether or not a respondent relied on sources for health care other than a primary care doctor, such as emergency rooms or clinics, varied according to several demographics or other identifying characteristics. For instance, males were more likely than females to rely on other sources for primary health care. In addition, non-white persons were more likely to rely on other sources for their health care compared to Whites. In terms of marital status, those who are not married were more likely to rely on other sources for health care.

Income and education also played a role. Respondents from households with progressively less income were more likely to rely on other sources for health care. Likewise, respondents who indicated they did not have health insurance coverage were more likely to rely on other sources for health care compared to persons with health insurance coverage. The less education a person had, the more likely they were to rely on other sources for health care. Location also influenced whether or not someone relied on other sources for health care. Residents of Canton were more likely to rely on other sources of health care compared to residents of other communities. Age was also a factor; the younger the person, the more likely they were to rely on other sources for health care.

All respondents were asked if there were any healthcare services that they or a member of their family needed in the past year that they were unable to get. More than one in ten, 10.1%, indicated there were needed services they were unable to get.

Whether a respondent was unable to receive needed health care services or not varied according to several demographic or other identifying characteristics of respondents. For instance, females were more likely than males to have been unable to get needed services. In addition, non-white persons were much more likely to not receive needed healthcare services. In terms of marital status, those who are not married were more likely to not receive needed healthcare services. Income and education also played a role. Respondents from households with progressively less income were more likely to have not received needed healthcare services. Respondents who were not college graduates were also more likely to have been unable to receive needed healthcare services. Likewise, respondents who indicated they did not have health insurance coverage were more likely to have been unable to get needed healthcare services compared to persons with health insurance coverage.

Location also influenced whether or not someone relied on other sources for health care. Urban residents of Stark County were more likely to have been unable to receive needed healthcare services compared to residents of suburban communities. Age was also a factor. Respondents aged 45 to 54 were most likely to be unable to get needed healthcare services; those ages 65 and over were least likely.

The 10.1% of respondents who were unable to obtain a needed health related service in the past year were asked a series of follow-up questions. First, these respondents were asked what services they were unable to get. This was an open-ended question in which respondents could give multiple responses. The healthcare service needed most often was dental services; this response was given by 19.8% of respondents who were unable to get needed healthcare services. Other needed healthcare services include, in order of importance, orthopedics (10.3%), medication (9.4%), other tests (7.7%), mental health services (6.6%), emergency room services (6.6%), and primary/preventative care (6.6%).

Healthcare Services Needed					
	# of 1st Responses	% of 1st Responses	# of all Responses	% of all Responses	% of Respondents
Dental services	19	17.9%	21	16.2%	19.8%

Miscellaneous	24	23.1%	25	19.7%	24.0%
Total	104	(n=104)	127	(n=127)	(n=104)

The respondents who were unable to get needed healthcare services were also asked why they were unable to get the needed services. Once again, this was an open ended question in which the respondent could give multiple responses. More than one-third of these respondents, 37.1%, indicated their lack of insurance was one reason they were unable to get needed healthcare. More than one-quarter, 27.0% cited they could not afford the needed services. Other reasons for being unable to obtain needed healthcare services included that the services were not covered by insurance (21.0%), they do not qualify for assistance (10.8%), the wait time (4.7%), and the needed service is not available in this area (3.9%).

Reasons Why Unable To Get Services					
	# of 1st Responses	% of 1st Responses	# of all Responses	% of all Responses	% of Respondents
No health insurance/unemployed	33	33.2%	37	32.3%	37.1%
Could not afford it	22	22.1%	27	23.5%	27.0%

Exercise

Stark Poll Summary: Exercise			
		<i>Percentage</i>	<i>N</i>
How often exercise per week	Not at all	15.7%	N=1,065
	Once in awhile	10.6%	
	1-2 times	20.2%	
	3-4 times	30.0%	
	5-7 times	23.5%	
Follow-up: What making it difficult to exercise (top 3)	Physical limitations	49.2%	N=153
	Too busy/no time	26.8%	
	Laziness/Procrastination	10.6%	

Next, respondents were asked if they participated in any physical activity or exercise such as walking, running, lifting weights, team sports, golf or gardening for exercise in the last month. The majority of respondents, 84.3%, had exercised in the past month; the remaining 15.7% did not exercise.

Of those who exercise, 12.6% only exercise once in a while (10.6% of all respondents). Nearly one-quarter of respondents, 23.9%, exercise one to two times a week (20.2% of all respondents). Another 35.6% of exercising respondents exercise 3 to 4 times per week (30.0% of all respondents), and 28.0% exercise 5 to 7 times a week (23.5% of all respondents).

How Often Exercise per Week		
	All Respondents	Respondents who Exercise
Not at all	15.7%	*
Once in awhile	10.6%	12.6%
1-2 times	20.2%	23.9%
3-4 times	30.0%	35.6%
5-7 times	23.5%	23.5%

The 15.7% of respondents who do not exercise on a regular basis were asked for some of the reasons that make exercise difficult. This was an open ended question in which respondents could give multiple responses. The most common response, given by nearly half, 49.2%, of all respondents who don't regularly exercise, was that they had a physical limitation that prevented them from exercising. The second most common reason, given by 26.8% of respondents, was that they were too busy or did not have the time. Other reasons that exercise was difficult include, in order of importance, laziness and procrastination (10.6%), they do not like exercise (6.4%), there is no need to exercise or it is not worth the time and effort (5.1%), and they are too old to exercise (4.8%).

Reasons Why Exercise is Made Difficult					
	# of 1 st Responses	% of 1 st Responses	# of all Responses	% of all Responses	% of Respondents
Physical limitations	70	46.0%	75	43.7%	49.2%
Too busy/No time	38	24.9%	41	23.8%	26.8%

	No- did not use	27.9%	
View on off label prescription use	It is not as much of a problem as everyone makes it out to be.	18.2%	N=23
	I know that it goes against medical advice, but plan to continue doing it.	34.0%	
	I know it is not advised and don't plan to do it again.	47.7%	

Smoking and Tobacco Use

All respondents were asked how often they currently smoke cigarettes or use tobacco products: every day, some days, or not at all. More than one quarter or 27.9% of respondents indicated they currently smoke cigarettes or use tobacco. The majority or roughly three-quarters, 71.7%, of tobacco users stated they use tobacco every day. **Every day users** amounted to 20.0% of all respondents. The remaining proportion of tobacco users indicated they smoke cigarettes or use tobacco less frequently or only **some days**, amounting to 7.9% of all respondents and 28.3% of tobacco users. Nearly three quarters, 72.1%, of respondents reported that they **do not use tobacco at all**.

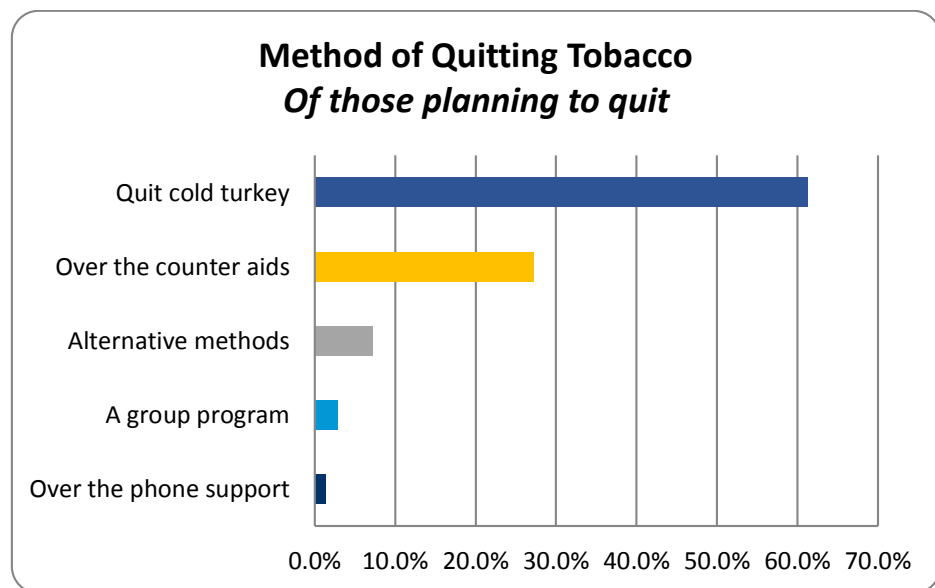

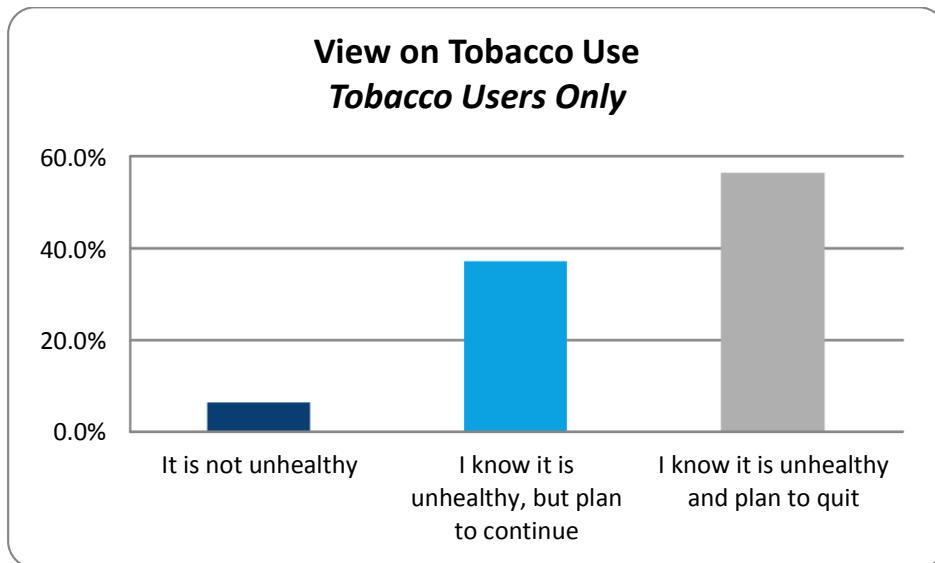

Tobacco use varied according to various demographics or other identifying characteristics of respondents. For instance, residents of the three core urban cities in the county were more likely to indicate they currently use tobacco compared to the remaining communities; 37.0% of urban residents reported they currently use tobacco compared to only 21.4% of suburban residents. People without health insurance were more likely to indicate they use tobacco compared to those with insurance. While half, 50.7%, of those without health insurance reported they currently use tobacco, only 24.9% of those with health insurance reported the same.

Household income was also strongly associated with cigarette smoking. Respondents from households with progressively less annual income, especially less than \$36,000 per year, were more likely to indicate they use tobacco compared to those from higher income households. In terms of employment status, the unemployed were much more likely to use tobacco, while retirees were much less likely to use tobacco. Homeownership status was also related to smoking activity. Those who rent their home were twice as likely as homeowners to smoke cigarettes or use tobacco.

Other groups of respondents that were more likely to smoke or use tobacco include those with a high school diploma or less education, respondents who are not married and non-white respondents.

Next, respondents who smoke or use tobacco were asked their view on tobacco use using three statements: (1) It is not as unhealthy as everyone makes it out to be, (2) I know it is unhealthy, but plan to continue smoking or using tobacco, and (3) I know it is unhealthy and plan to quit. More than half, 56.4% reported that they knew it was unhealthy and plan to quit (15.4% of all respondents). More than one-third, 37.2%, indicated that they know tobacco use is unhealthy, but they plan on continuing (10.2% of all respondents). Only a small percentage of tobacco users, 6.4%, think that tobacco use is not as bad as everyone makes it out to be (1.8% of all respondents). The 15.4% of tobacco users who plan to quit, were read a list of seven possible methods and asked which they would use. The method mentioned most often was to quit cold turkey, as indicated by 61.3% of respondents. Another 27.2% of respondents planned to quit by using over the counter aids. Other methods of quitting tobacco include, in order of importance, alternative methods (7.2%), a group program (2.8%), and over the phone support (1.4%).

Alcoholic Beverages

Next, all respondents were asked if they drink alcoholic beverages such as beer, wine, malt beverages, or liquor every day, some days, or not at all. Nearly half or 49.1% of respondents indicated they drink alcohol. Unlike tobacco users, the majority of alcohol drinkers, or 95.2% stated they drink alcohol some days. **Every day user's** amounted to just 2.4% of all respondents. The remaining proportion of alcohol drinkers indicated that they drink less frequently or only **some days**, amounting to 46.7% of all respondents. More than half, 50.9%, of respondents reported that they **do not drink alcohol at all**.

The 49.1% of respondents who drink alcohol were asked how many alcoholic drinks they consume each week on average. The responses ranged from zero to one hundred, with an average of 4.2 drinks a week. The average number of alcoholic drinks a respondent consumed varied greatly by whether or not the respondent indicated that they drink some days or every day. Respondents who consume alcoholic beverages **some days** consume an average of 3.4 alcoholic beverages per week, whereas every day consumers drink an average of 19.8 alcoholic beverages per week.

Alcohol consumption varied according to various demographics or other identifying characteristics of respondents. However, the demographic differences were significantly different from the groups of respondents that used tobacco. For instance, while residents of the three core urban cities in the county were more likely to indicate they currently use tobacco compared to the suburban communities in the county, suburban residents were more likely than urban residents to consume alcoholic beverages. More than half, 53.1% of suburban residents reported that they currently consume alcohol compared to 43.7% of urban residents. Other groups of respondents that were more likely to consume alcoholic beverages include those with a some college or more education, males, respondents ages 18 to 44, and those with an annual income of \$54,000 or more.

Next, the 10.2% of respondents who drink six or more alcoholic beverages per week were asked their view on alcohol consumption using three statements: (1) The health risks are not as great as everyone makes it out to be, (2) I know the health risks, but plan to continue drinking alcoholic beverages, and (3) I know there are health risks and plan to stop drinking or drink less. A small percentage, 15.7%, reported that they knew the health risks and planned to stop drinking or to drink less (1.5% of all respondents). Nearly two-thirds, 62.1%, indicated that they know there are health risks, but they plan on continuing anyways (6.2% of all respondents). Nearly one-quarter of alcohol drinkers, 22.7%, think that alcohol assumption is not as bad as everyone makes it out to be (2.3% of all respondents).

Prescription Drugs

All respondents were asked if they have taken prescription medications in the past year. If the respondent answered yes, they were then asked if they had used any of the medications differently than prescribed such as more frequently or in a higher dose than directed by their doctor. More than one-quarter of respondents, 27.9% had not used a prescription medication in the past year. More than two-thirds, 69.8%, indicated that they had used prescriptions in the past year, but used it as prescribed. Only a small percentage, 2.3%, used prescriptions other than how they were prescribed.

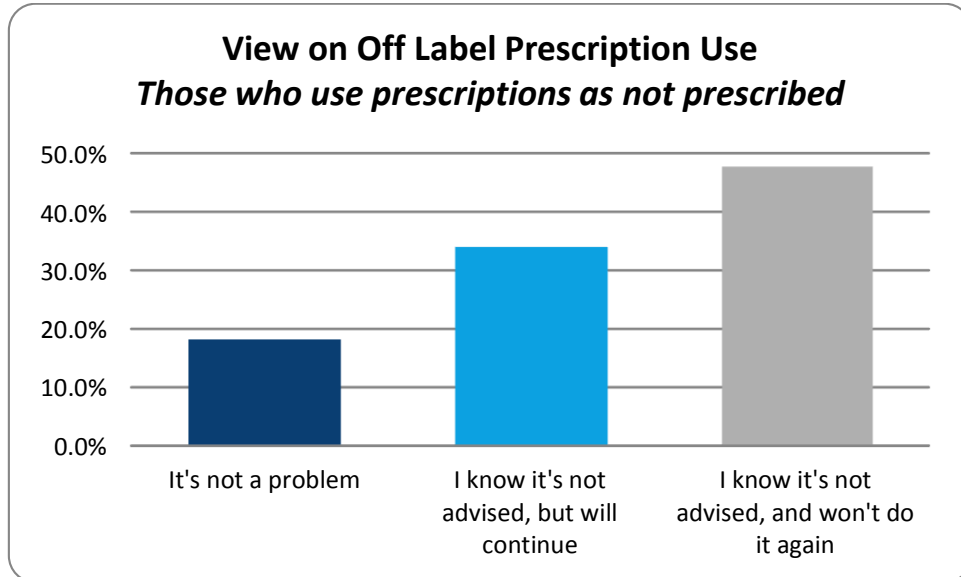

Prescription use varied according to various demographics or other identifying characteristics of respondents. Groups of respondents that were more likely to use prescriptions other than as prescribed include the unemployed and respondents ages 18 to 24. Groups of respondents that were more likely to take prescription medication as prescribed include retired respondents, females, those ages 55 and older, and respondents with an annual income of \$18,000 or less. Groups of respondents that were more likely to have not used prescription medications at all include respondents who are employed full-time, those with children in the home, males, and respondents ages 18 to 44.

Next, the 2.3% of respondents who reported that they use medications other than how they are prescribed were asked why they took the medications this way. The most common response was that the prescription was insufficient. This response was given by 36.0% of all respondents. Another 33.7% took medication other than how it was prescribed for pain management.

Reason For Off Label Prescription Use					
	# of 1 st Responses	% of 1 st Responses	# of all Responses	% of all Responses	% of Respondents
Insufficient prescription	8	35.7%	8	32.9%	36.0%
Pain management	5	24.0%	7	30.8%	33.7%
Avoid side effects	5	25.1%	5	23.1%	25.3%
Helps to sleep/stay awake	2	11.0%	2	10.1%	11.0%
To experience a high	1	4.2%	1	3.9%	4.3%
Total	21	(n=21)	23	(n=23)	(n=21)

Next, the 2.3% of respondents who took prescription medication other than how it was described were asked their view on prescription misuse using three statements: (1) It is not as big of a problem as everyone makes it out to be, (2) I know it is against medical advice, but plan to continue, and (3) I know it is not advised and don't plan on doing it again. Nearly half, 47.7% reported that they know it is not advised and plan to stop (1.0% of all respondents). More than one-third, 34.0%, indicated that they know it is not advised, but they plan on continuing (0.7% of all respondents). Less than one-fifth, 18.2% think that using prescriptions other than how they are prescribed is not as bad as everyone makes it out to be (0.4% of all respondents).

Obesity and Access to Healthy Food

Stark Poll Summary: Obesity and Access to Healthy Food			
		Percentage	N
Self-described weight	Overweight	44.2%	N=1,065
	About right	51.2%	
	Underweight	4.6%	
Tried to lose weight in last 12 months	Yes	57.4%	N=1,066
	No	42.6%	
Been successful at losing and maintaining	Yes	83.3%	N=610
	No	16.7%	
Most influence on food choices	Nutritional information	37.5%	N=1,033
	Cost	15.9%	
	Access of accessibility	7.9%	
	Convenience	19.3%	
	Advertisements	2.2%	
	Meals prepared by family member	17.2%	

All respondents were asked to describe their personal weight using a 5-point scale: very underweight, somewhat underweight, about right, somewhat overweight, or very overweight. More than half of the respondents, 51.2%, reported that their weight is about right. Slightly fewer, 44.1%, reported being overweight with 38.3% being somewhat overweight and 5.8% being very overweight. Just a small percentage, 4.6%, reported being underweight, with 4.0% being somewhat underweight and 0.6% being very underweight.

The weight of respondents varied according to various demographics or other identifying characteristics. Groups of respondents more likely to be **overweight** included: suburban residents, retired and unemployed respondents, females, those ages 35 to 64, married respondents, and those with an annual income of \$18,000 or less. Groups of respondents more likely to be **about right** included: urban residents, males, those ages 18 to 34, respondents who are not married, and non-white respondents. Groups of respondents that were more likely to be **underweight** included: respondents who are employed part-time, those ages 18 to 24, and respondents with an annual income of \$18,000 or less.

All respondents were asked if they had thought about or tried to lose weight during the past year. More than half of respondents, 57.4% had thought about or tried to lose weight in the last year. As would be expected, there were large differences between how a person described their weight and whether or not they had tried to lose weight in the last 12 months. For respondents who described themselves as underweight, 14.3% had tried to lose weight in the last year. For respondents who characterized their weight as just about right, more than one-third, 35.1%, had indicated they had tried to lose weight. The majority of respondents who thought they were overweight, 87.7% had tried to lose weight in the past year.

In addition to weight, there were other demographic and other identifying characteristics among those who did and did not try to lose weight in the past year. Groups of respondents that were more likely to have tried losing weight include respondents who are employed, college graduates, those ages 35 to 64, married respondents, those with an annual income of \$54,000 or more, and respondents with children in the home.

Next, the 57.4%, of respondents who had tried to lose weight in the past 12 months were asked if they felt they were successful at losing or maintaining their weight. The majority of respondents, 83.3%, felt they were successful at losing or maintaining their weight, the remaining 16.7% felt unsuccessful.

Next, all respondents were asked what source had the most influence on their food choices on a daily basis. The possible sources of influence included nutritional information such as calorie or fat count, cost, access or availability, convenience, advertisements, and meals prepared for them by a family member.

The source of greatest influence on food choices was **nutritional information** such as calorie or fat count. More than one-third, 37.5%, of respondents named this as having the most influence on their daily food choices. Groups of respondents more likely to select nutritional information as the main influence on their food choices include suburban residents, those who are retired, college graduates, respondents ages 65 and over, and those with an annual income of \$72,000 or more.

The source of second greatest influence on food choices was **convenience**. Nearly than one-fifth, 19.3%, of respondents named this as having the most influence on their daily food choices. Groups of respondents that were more likely to select convenience as the main influence on their food choices include respondents who are employed full-time, those ages 35 to 54, and those with an annual income between \$54,000-\$72,000.

Slightly fewer, 17.2% of respondents, indicated that the greatest influence on their daily food choices was **meals prepared for them** by a family member. Groups of respondents that were more likely to name this source of influence include unemployed respondents, males, those ages 18 to 24 or 35 to 44, non-white respondents, and those with an annual income of \$72,000 or more.

Another 15.9% of respondents cited **cost** as having the most influence on their daily food choices. Groups of respondents that are more likely to select cost as their main influence include urban residents, those who are employed part-time, respondents with a high school diploma or less education, those with an annual income of \$36,000 or less, and renters.

The last two sources of influence on food choices were selected by just a small portion of respondents. The percentage of respondents that selected **access or availability** amounted to 7.9% of respondents, while just 2.2% selected **advertisements**. Groups of respondents that were more likely to choose access or availability included those ages 25 to 34 and respondents with an annual income of \$18,000 or less. Groups of respondents that were more likely to select advertisements include unemployed respondents, and respondents with an annual income of \$18,000 or less.

Immunizations

Stark Poll Summary: Immunization			
		Percentage	N
Get flu vaccination in past year	Yes	43.3%	N=1,066
	No	56.7%	
Follow-up: Main reason did not get flu vaccination (top 3)	Not concerned about flu	38.6%	N=587
	Worried about safety of the vaccine	25.5%	
	Lazy/Forgot/ No time	13.9%	

Next, respondents were asked if they got a flu vaccination in the last year. Less than half, 43.3%, indicated that they did get a flu shot in the last year. The remaining 56.7% did not get a flu shot.

Whether or not a person received a flu vaccination in the last year varied according to various demographics or other identifying characteristics of respondents. Age was perhaps the largest indicator as to whether or not a person received a flu shot. The age group that was most likely to have gotten a flu vaccination in the past year was respondents ages 65 and over. More than two-thirds, 67.6%, of respondents in this age group reported getting a flu vaccination in the past year. Considerably fewer respondents, 28.6%, ages 18 to 34 reported getting the flu vaccination.

Other groups of respondents that were more likely to have received the flu vaccination include retired respondents, college graduates, females, respondents ages 65 and over, married respondents, and homeowners.

The 56.7% of respondents who did not get a flu vaccination in the past year were asked a follow-up question as to why they did not get the vaccine. This was an open ended question in which respondents could give one answer. The most common reason for not getting the flu vaccination was that the respondent was not concerned about the flu or thought the threat of the flu was blown out of proportion. This response was given by 38.6% of respondents who did not get the flu vaccine, or 21.2% of all respondents. Another one-quarter of respondents who did not get vaccinated, 25.5%, did not get the vaccination because they were worried about the safety of the vaccine or the potential side effects of the vaccine (14.1% of all respondents). Other reasons for not receiving the flu vaccination include, in order of importance, they are lazy or just forgot (13.9%), they are healthy or not in a high risk group (5.4%), they had a negative experience with the flu vaccination in the past (4.3%), and the cost of the vaccine (4.1%).

Reason Not Get Flu Vaccine		
	# of Responses	% of Sample
Not concerned about flu [blown out of proportion]	226	38.6%
Worried about safety of the vaccine or potential side	150	25.5%
Lazy/Forgot/ No time	82	13.9%
I am healthy/not in an at risk group	32	5.4%
Negative past experience	25	4.3%
Cost	24	4.1%
Health condition prevented me	22	3.7%
Do not like needles/shots/doctors	13	2.3%
Did not know where to get one	7	1.2%
Doctors supply ran out	3	0.5%
Miscellaneous	3	0.6%
Total	587	(n=587)

Texting and Driving

Stark Poll Summary: Texting			
		Percentage	N
Have a cell phone	Yes	87.2%	N=1,067
	No	12.8%	
Text or email while driving	Yes	17.7%	N=930
	No	82.3%	

Finally, respondents were asked a series of questions about texting and driving. First, all respondents were asked if they had a cell phone. The majority of respondents, 87.2%, indicated that they had a cell phone. Respondents who had a cell phone were then asked if they text or email while driving. More than one-sixth, 17.7%, indicated that they had sent or received text messages or emails while driving, accounting for 15.4% of all respondents.

Whether or not a person has a cell phone or texts/emails when they drive varied according to several demographic or other identifying characteristics of respondents. Groups that were more likely to **have a cell phone** include employed respondents, those with some college or more education, respondents ages 18 to 44, married respondents, those with an annual income of \$54,000 or more, and respondents with children in the home. Groups of respondents that were more likely to **text or e-mail while driving** include suburban residents, those who are employed full-time, college graduates, males, respondents ages 18 to 44 (especially those ages 18 to 24), those with an annual income of \$18,000 or less, and respondents without children.

Health Insurance

All respondents were asked if they had health insurance coverage. A significant portion, 13.3% did not have health insurance, a slight decrease from 14% in 2009. In 2001, 46.4% of respondents were covered by employer paid plans, 14.1% were covered by private insurance, and 26.3% reported being covered by Medicare or Medicaid.

Health Insurance Coverage by Select Demographics, 2011				
		Yes	No	Valid Response
All respondents		86.7%	13.3%	1,038

STARK POLL RESULTS BY RACE

As part of the Stark Poll, a total of 69 African Americans were interviewed. In order to achieve a sample large enough in size to examine this population independently, an additional 156 surveys were completed with African American residents. The final sample size for African Americans with the oversample cases included was 225. The general population statistics derived from the sample size provide a precision level of plus or minus 6.5% within a 95% confidence interval.

As you will see throughout this appendix, there are significant differences in response choices based on race. The tables below show the Stark Poll results by race. Race was divided as white, African American, and other. Questions that had statistically significant differences based on race are marked with a *.

Overall Needs and Health

Stark Poll Summary: Overall Needs and Health				
		White	African American	Other

Patient Focus Group Results

The Center for Marketing and Opinion Research (CMOR) conducted two focus groups on behalf of Mercy Medical Center to collect patient perception data to be included in Mercy Medical Center's Community Health Needs Assessment Implementation Plan. The two groups included patients from the Ambulatory Care Clinic (ACC) and the Dental Clinic (DC).

KEY FINDINGS

- ✓ Both the Ambulatory Care Clinic and the Dental Care Clinic are important community assets that help meet the community health needs identified in the CHNA.
- ✓ The community healthcare need mentioned most frequently by participants in the focus groups was issues related to health insurance coverage such as a high number of people without insurance, young adults without insurance, the cost of health insurance coverage, that most insurance plans don't cover dental and vision, and how difficult it is to qualify for needed benefits.
- ✓ If the Dental Clinic were not available, many participants indicated that they would not go to the dentist or would elect to have teeth pulled as opposed to fixed.
- ✓ If the Ambulatory Care Clinic were not available, the participants would have to go to Stat Care or an Emergency Room for treatment and many indicated that they would not seek preventative care.
- ✓ In terms of best methods to reach out to potential patients, there is not a 'one-size-fits-all' solution. Current patients heard about the clinics through a variety of sources including word of mouth, the emergency room, and the United Way 211 program. They also differed in terms of how they currently receive health related information and how they would like to receive this type of information in the future.
- ✓ There were distinct differences between the ACC patients and the Dental Clinic patients in that ACC patients were less likely to have insurance, more likely to use the clinic or the emergency room instead of a primary care physician and more likely to have needed services in the last year that they were unable to get. Dental Clinic patients were more likely to be insured and to use a primary care physician for their health care needs.

FOCUS GROUP RESULTS

COMMUNITY NEEDS

- ✓ When participants were asked what they felt was the most important issue facing the community, nearly half of all responses centered around health insurance issues such as a high number of people without insurance, young adults without insurance, the cost of health insurance coverage, most insurance plans don't cover dental and vision, and how difficult it is to qualify for needed benefits.
- ✓ In addition to access to insurance benefits, it was noted that people without insurance are treated differently when they go to the hospital for treatment; that they are given the 'basics' and then sent home.
- ✓ Other healthcare issues mentioned included: the Social Security/Medicaid/Medicare system (you have to pay into the system and then when you need it, you have to pay again), diabetes, obesity, unhealthy diets, the cost of healthcare services, the need for additional mental health services with the recent closing of Trillium, and the high use of emergency rooms for non-emergent cases.
- ✓ Participants cited the need for more health related seminars and educational programs to address the community health needs. Specifically mentioned was the need for women's health education to minimize unwanted pregnancies and diseases.
- ✓ When asked what medical services are most needed in their community, the medical service mentioned most often was Dental services. Other services mentioned included vision and services for children with Autism.
- ✓ Several participants, in both groups, mentioned the high cost of dental care and, even with insurance, many times they have been forced to have a tooth pulled as opposed to fixed because of the cost.

• • •
*"Everything I have gotten here
(at Mercy) is top notch."*
Dental Clinic Patient
• • •

**BARRIERS TO HEALTHCARE**

- ✓ Participants mentioned the following barriers that keep people from obtaining access to healthcare services that they need: transportation, language barriers, jobs that provide insurance.
- ✓ Participants reported that they worry most about:
 - Not being able to afford life insurance and worrying about what would happen to her kids if something happens to her
 - Being able to afford treatment if they get sick.
 - The lack of healthy food options
 - Diabetes
 - Trying to stay healthy to avoid seeing the doctor
 - Medication formularies and what insurance companies are willing to pay for
- ✓ The Ambulatory Care Clinic patients use the clinic most often when they are in need of healthcare. Dental Clinic patients are most likely to use a family doctor, Stat Care and the emergency room. All patients from the Ambulatory Care Clinic had been to the Emergency Room in the past year with half reporting having used the Emergency Room five or more times. For the Dental Clinic patients, all but one had used the emergency room in the past year with one using it five or six times.
- ✓ The Dental Clinic patients utilize the clinic for their dental care most often. All have been to the dentist in the past year. Prior to this year when they first heard of the clinic, it had been 4 or 5 years since they have been to the dentist.
- ✓ For the Ambulatory Care Clinic patients, there were several services that they or someone in their family had needed in the past year that they were unable to get. These services included mental health services (where they could go and talk to someone, not just be medicated), dental, vision/glasses, and prescriptions/medications. Dental Clinic patients indicated vision as a healthcare service they were unable to obtain in the last year.

MERCY'S ROLE

- ✓ Overall, participants had a very favorable opinion of Mercy Medical Center as a healthcare provider. One ACC participant said that Mercy is the best hospital in Stark County while another said they would choose Mercy over Cleveland Clinic any day of the week. One of the dental clinic participants said that the staff at the clinic does an excellent job at calming her dental anxiety.
- ✓ In terms of what Mercy's role in serving the community should be, participants mentioned several things that Mercy is currently doing as well as several things that Mercy could do to better serve the community. One suggestion was for Mercy to have a center or a place to go where people can get information about what services they need, what services are available and where they can get it. Other suggestions include:
 - Have more educational sessions and seminars
 - Offer a free clinic and free screenings
 - Have a mobile medical truck/bus for screenings, etc. in the community
 - Make sure that advertisements are shared through several different mediums and not just on the internet because not everyone uses a computer
 - Do outreach and education at the local schools
 - Provide educational materials on preventative care topics
 - Reach out to people who are homeless
 - Offer vision services at a time they can access it
- ✓ About half of the ACC patients and only one Dental patient had heard of St. Paul Medical Home.
- ✓ The overall perception of how the patients feel when they go to Mercy is that they feel very welcomed and positive. One ACC patient mentioned that Mercy will work with you regardless of what you can pay, and several mentioned how nice and friendly the staff is and that the service is prompt.
- ✓ In addition, participants felt that the staff at the clinics explains their health condition in a way that they can understand. One ACC participant noted that they always explain the medical condition and then ask, "do you understand?" One woman who has been in the U.S. for only three years said that the staff always explains to her the words that she doesn't understand. A dental clinic participant reported that, at times, he hears probably more than he wants to hear because of the residency program.
- ✓ Several Ambulatory Care Clinic patients have utilized other Mercy services including Dr. Stetler (a family doctor), physical rehabilitation, the dental clinic, the Centering Program, and a program to help stop smoking. None of the Dental Clinic participants had used other Mercy services or programs.

● ● ●
*"Yes (they explain everything),
they don't leave you wondering...
"What does that mean?"*
Ambulatory Care Clinic Patient
● ● ●

- ✓ There were several questions that were asked just of Dental Clinic patients. Reasons the participants initially came to the clinic included that they were looking for services they could afford or they were having a dental issue. Current dental needs include routine care and cleaning, crowns and implants. In terms of how Mercy has helped meet their dental needs, participants mentioned that the clinic has been very flexible with their schedules, they call them when they have a cancellation, they get them right in, and the clinic takes credit cards. One patient stated that the clinic staff makes sure that they have the best care and they call in the experts when needed.
- ✓ The impact on the lives of dental clinic patients has been profound. Specifically:
 - Wouldn't be able to get the care they need at a cost they can afford anywhere else
 - It gives piece of mind
 - Wouldn't be getting routine care if Mercy wasn't here and wouldn't go as often.
- ✓ Other comments about Mercy Medical Center that were mentioned throughout the sessions include:
 - The waiting time in Mercy's Emergency Room is much less than at Aultman.
 - Doctors and nurses are much nicer at Mercy.
 - Mercy reminds you about your appointments- they always call.

● ● ●
*"Because dental health is related
to physical health, don't know
where I would be without it."*

Dental Clinic Patient

COMMUNICATION AND EDUCATION

- ✓ There are many different avenues through which participants heard of the Ambulatory Care and Dental Clinics. The most common avenue mentioned was through word of mouth/family and friends. Other ways that participants heard about the clinics include United Way's 211, through Mercy's Emergency Room, the phone book, Mercy Medical Center's Programs, insurance companies and on the Internet. One participant learned of the dental clinic through Massillon's free dental clinic.
- ✓ Participants currently get health related information from the following sources:
 - Word of mouth
 - Department of Job and Family Services; they have a billboard with a lot of information on it
 - On-line
 - Fliers at hospitals and offices
- ✓ In terms of how they would like to receive future information, the participants offered the following:
 - Always remind patients of appointments
 - For younger people, reach out to them over email
 - Television
 - Advertise in the newspaper or have a flier in the newspaper
 - Radio
 - In the telephone book

**ADVICE TO THE MERCY**

- ✓ Participants offered the following pieces of advice to Mercy to help them better meet the needs of their patients and the community:
 - Education
 - Be more open to some alternative medicines or natural solutions instead of concentrating on paying for medicines that they may not need
 - Advertise more things that they have
 - Provide services in the Carrollton area
 - Find a way to provide vision services

HEALTH OUTCOMES

Health Outcome Ranking

Health outcomes in the *County Health Rankings* represent how healthy a county is. It measures two types of health outcomes: how long people live (mortality) and how healthy people feel while alive (morbidity).

County	Rank	County	Rank	County	Rank
Adams	85	Hocking	42	Scioto	88

Highland	78	Sandusky	38		

DESCRIPTION:
 To calculate the summary score for Health Outcomes, County Health Rankings (CHR) combined scores for Mortality (50%) and Morbidity (50%) to produce 100% of the Health Outcomes summary score. The weights for specific measures were assigned based on relative importance within the factor and considerations of data reliability and availability. Within morbidity, CHR assigned a higher weight to the low birth weight measure since this measure is based on a census of all live births whereas the other measures are based on a survey of a sample of the population.

Mortality Ranking Part of the Health Outcome Ranking

Mortality rankings in the *County Health Rankings* measure what are known as **premature deaths** (deaths before age 75).

County	Rank	County	Rank	County	Rank
Adams	87	Hocking	40	Scioto	88
Allen	36	Holmes	8	Seneca	20

	Deaths	YPLL Rate
Stark	4,448	6,985
Carroll	371	6,912
Tuscarawas	1,050	6,112
Ohio	138,370	7,457

DESCRIPTION: Premature death is represented by the years of potential life lost before age 75 (YPLL-75). Every death occurring before the age of 75 contributes to the total number of years of potential life lost. For example, a person dying at age 25 contributes 50 years of life lost, whereas a person who dies at age 65 contributes 10 years of life lost to a county's YPLL. The YPLL measure is presented as a rate per 100,000 population and is age-adjusted to the 2000 US population.

Morbidity Ranking

Part of the Health Outcome Ranking

Morbidity is the term that refers to how healthy people feel while alive. Specifically, CHR reports on the measures of their health-related quality of life (their overall health, their physical health, their mental health) and at birth outcomes (in this case, babies born with a low birth weight).

% Poor or fair health	
Stark	14%
Carroll	21%
Tuscarawas	14%
Ohio	15%

DESCRIPTION: Self-reported health status is a general measure of health-related quality of life (HRQoL) in a population. This measure is based on survey responses to the question: “In general, would you say that your health is excellent, very good, good, fair, or poor?” The value reported in the *County Health Rankings* is the percent of adult respondents who rate their health “fair” or “poor.”

SOURCE: County Health Ranking. Original Source: The Behavioral Risk Factor Surveillance System (BRFSS)

	Poor Physical Health Days	Poor Mental Health Days
Stark	3.2	3.6
Carroll	5.4	4.3
Tuscarawas	4.3	3.2
Ohio	3.6	3.8

DESCRIPTION- Poor physical health days is based on survey responses to the question: “Thinking about your physical health, which includes physical illness and injury, for how many days during the past 30 days was your physical health not good?” The value reported in the *County Health Rankings* is the average number of days a county’s adult respondents report that their physical health was not good.

Poor mental health days is based on survey responses to the question: “Thinking about your mental health, which includes stress, depression, and problems with emotions, for how many days during the past 30 days was your mental health not good?” The value reported in the *County Health Rankings* is the average number of days a county’s adult respondents report that their mental health was not good.

% Diabetic	
Stark	11%
Carroll	11%
Tuscarawas	11%
Ohio	11%

DESCRIPTION- This measure represents the prevalence of diagnosed diabetes in a given county. Respondents were considered to have diagnosed diabetes if they responded "yes" to the question, "Has a doctor ever told you that you have diabetes?"

SOURCE: County Health Ranking. Original Source: National Center for Chronic Disease Prevention and Health Promotion, Division of Diabetes Translation, 2009.

	Number of HIV cases	HIV Rate
Stark	288	90
Carroll	7	29
Tuscarawas	12	16
Ohio	16,265	169

DESCRIPTION- The HIV rate is the number of persons living with a diagnosis of human immunodeficiency virus (HIV) infection per 100,000 population.

SOURCE: County Health Ranking. Original Source: National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention, 2009.

HEALTH FACTORS

Health Factors Ranking

Health factors in the *County Health Rankings* represent what influences the health of a county. It measures four types of health factors: health behaviors, clinical care, social and economic, and physical environment factors. In turn, each of these factors is based on several measures. A fifth set of factors that influence health (genetics and biology) is not included in the *Rankings*.

DESCRIPTION
 To calculate the summary score of health factors, weights were determined for each of the four major factors (Health behaviors, Clinical care, Social and economic factors, and the Physical environment) based on a review of the literature, expert opinion, and data analysis. The following weights were used to calculate the overall Health Factors summary score: Health behaviors (30%), Clinical care (20%), Social and economic factors (40%), and the Physical environment (10%). Like the Health Outcomes summary score, weights at each level sum to 100%.

MV Crash Death Rate	
Stark County	10
Carroll	18
Tuscarawas	12
Ohio	11

DESCRIPTION: Motor vehicle crash deaths are measured as the crude mortality rate per 100,000 population due to traffic accidents involving a motor vehicle. Motor vehicle deaths include traffic accidents involving motorcycles; 3-wheel motor vehicles; cars; vans; trucks; buses; street cars; ATVs; industrial, agricultural, and construction vehicles; or bicyclists and pedestrians when colliding with any of the previously listed motor vehicles. Deaths due to boating accidents and airline crashes are not included in this measure. In prior years, non-traffic motor vehicle accidents were included in this definition. Our definition has changed to better align with Healthy People 2020.

	# Medicare Enrollees	Preventable Hospital Rate
Stark County	29,328	79
Carroll	2,298	69
Tuscarawas	8,227	100
Ohio	986,273	64

DESCRIPTION: Preventable hospital stays is measured as the hospital discharge rate for ambulatory care-sensitive conditions per 1,000 Medicare enrollees. Ambulatory-care sensitive conditions (ACSC) are usually addressed in an outpatient setting and do not normally require hospitalization if the condition is well-managed. Hospitalization for diagnoses treatable in outpatient services suggests that the quality of care provided in the outpatient setting was less than ideal. The measure may also represent a tendency to overuse hospitals as a main source of care.

	High School Graduation Rate	% with Some College
Stark	78%	60.1%
Carroll	88%	42.9%
Tuscarawas	91%	45%
Ohio	88%	61.2%

DESCRIPTION: High school graduation is reported as the percent of a county's ninth-grade cohort in public schools that graduates from high school in four years. Some college represents the percent of the population ages 25-44 with some post-secondary education, such as enrollment at vocational/technical schools, junior colleges, or four-year colleges. It includes individuals who pursued education following high school but did not receive a degree.

	% with Inadequate Social Support	# of single-parent households	% Single Parent Households
Stark	19%	29,999	35%
Carroll	NA	1,308	20%
Tuscarawas	22%	5,273	24%
Ohio	20%	918,605	34%

DESCRIPTION: The social and emotional support measure is based on responses to the question: “How often do you get the social and emotional support you need?” The *County Health Rankings* reports the percent of the adult population that responds that they “never,” “rarely,” or “sometimes” get the support they need.

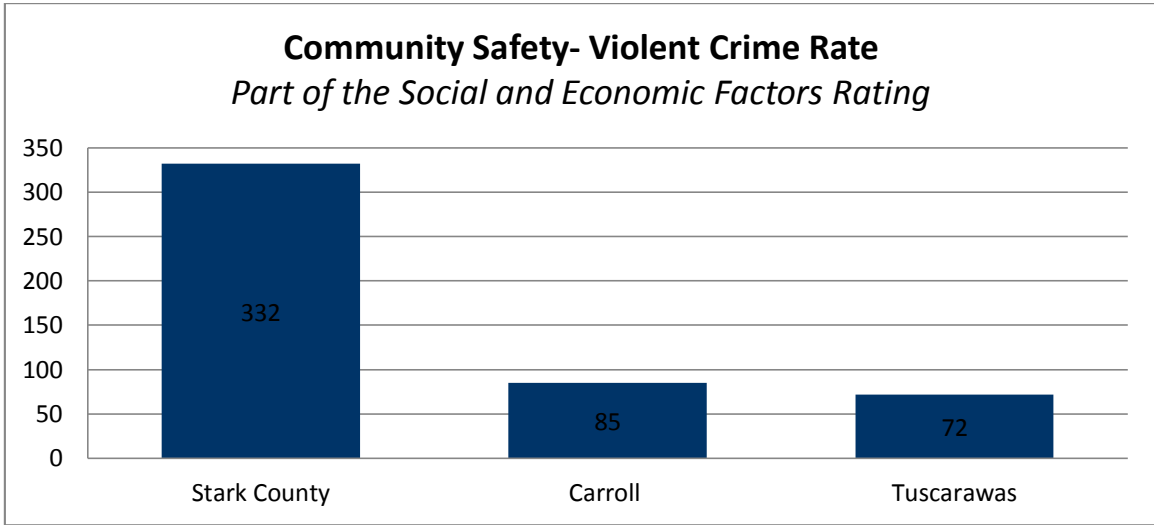

Percentage of single parent households is the percent of all children in family households that live in a household headed by a single parent (male or female head of household with no spouse present).

Average Daily PM25	
Stark County	14.2
Carroll	14.4
Tuscarawas	14.1
Ohio	13.4

DESCRIPTION: This measure represents the average daily amount of fine particulate matter in micrograms per cubic meter (PM2.5) in a county. Fine particulate matter is defined as particles of air pollutants with an aerodynamic diameter less than 2.5 micrometers. These particles can be directly emitted from sources such as forest fires, or they can form when gases emitted from power plants, industries and automobiles react in the air.

	# Limited Access	% Limited Access
Stark County	26,164	7%
Carroll	527	2%
Tuscarawas	5,654	6%
Ohio	681,167	6%

DESCRIPTION: Limited access to healthy foods captures the proportion of the population who are low income and do not live close to a grocery store. Living close to a grocery store is defined differently in rural and non-rural areas; in rural areas, it means living less than 10 miles from a grocery store whereas in non-rural areas, it means less than 1 mile. Low income is defined as having an annual family income of less than or equal to 200 percent of the federal poverty threshold for the family size.

STARK POLL: 2013 QUALITY OF LIFE SERIES

The 2013 Stark County Collaborative Poll included a set of Quality of Life Questions that asked respondents to rate a series of quality of life indicators in Stark County. Respondents were also asked to indicate what they felt was the most important problem facing Stark County right now. Employment issues such as high unemployment, job loss, and not enough jobs were cited most frequently with 37.9% of the respondents indicating this to be the case. Following employment issues, respondents mentioned crime and safety concerns, 19.8%, tax and money issues, 12.9%, government and political issues, 10.4%, education issues, 7.4%, and concerns about housing, 3.3%.

The majority of the survey respondents were satisfied with Stark County as a place to live, with 72.2% of respondents, rating Stark County as an excellent or good place to live, and only 6.9% rating Stark County as poor or very poor. The perception of the county as a place to live has remained relatively unchanged over the past seven years.

Stark County residents rated the quality of healthcare services available in the county higher than the rating given for the economy or the availability of job opportunities with 76.9% of respondents giving a rating of either excellent or good to the quality of healthcare.

Although only slightly more than a quarter of respondents, 25.4%, rated the local economy favorably and 31.4% rated the local economy negatively, positive ratings of the economy were higher in 2013 than the past six years. Similarly, only 16.2% rated the availability of job opportunities favorably. A significant portion of respondents, 42.8%, rated the availability of job opportunities in the county as either poor or very poor. Though positive ratings of job opportunities were low in 2013, they were higher than the past six years.

Respondents were asked if they were better or worse off financially than a few years ago. The largest portion, 37.6%, of respondents indicated that they were worse off financially, while 30.9% of respondents reported being better off and 31.5% reported being about the same.

Finally, respondents were asked if Stark County was headed in the right direction or was off on the wrong track. 58.7% of respondents indicated that they thought the county was headed in the right direction, an increase from 2012.
